Major Depressive Disorder in Chronic Kidney Disease

Tuesday, December 10, 2019 | 12pm ET | 9am PT

The burden of Chronic Kidney Disease (CKD) for patients is multifactorial, including having psychiatric consequences such as Major Depressive Disorder (MDD). While the interplay between the two is not clearly defined, both CKD and MDD can impact medical outcomes. In this discussion, Drs. Bojrab (a psychiatrist) and Kang (a nephrologist) will discuss the challenges and opportunities for patients with these comorbid conditions.

Speakers are paid consultants to Otsuka Pharmaceutical Development & Commercialization, Inc.
